# About This Documentation

## From the desk of Gustavo Huber

When Dave, Thomas, and I started Next Thing Co. in 2013, it was with a simple goal: we wanted to create things that would inspire creativity, and help people chase their own ideas of what needed to exist.

We considered this goal both in terms of how economically accessible we could make our products (they had to be \$99 or less), as well as how much “pain” we could remove from the design process for others (they had to be open source and well-documented).

Our first attempt was a software-defined camera named OTTO, built around an off-the-shelf embedded module. But early in development, we knew that our end-goals were at risk. The \$39 module made it impossible to ship product priced under \$99. It lacked Mainline Linux support, a reliable tool-chain, documentation and functional drivers making software development a cat-and-mouse game of bug tracking. But thanks to lots of long days, and some good friends both in Shenzhen and back home in Oakland, we built and shipped out 500 OTTOs -- a serious feat.

Almost exactly a year later, we shipped out the first of what is now over 100,000 C.H.I.P.s delivered worldwide. At \$9, C.H.I.P. was the fruition of our vision from a year prior: accessible, powerful technology, available to everyone for hobby, education, or products. In so many words, we were building the tools that we wished we'd had before.

The reaction was (and continues to be) astounding! Tweets and emails come from far and wide to tell us about impossible projects banged together in an afternoon, classrooms full of proud 10-year-old game developers who had never before written a line of code, and seasoned engineers brought back to memories of discovering their passion on a Commodore 64, 40 years prior. Yet, just as building OTTO showed us the tools we were missing, building C.H.I.P has taught us what it takes to scale production to keep up with [even unprecedented] demand.

So it is with great pleasure that I invite you to explore, without non-disclosure agreements or any other obstructive formalities, this datasheet for C.H.I.P. Pro: the newest addition to the Next Thing Co. family.

Thanks to the experience and support from our friends at Allwinner and Nanya, C.H.I.P. Pro is built from the ground up for clean and reliable design. From in-package DDR3 DRAM in the GR8 SiP (which allows us to buy known-good-die DRAM rather than market components), to keeping the onboard NAND, Bluetooth, WiFi, and power management that made C.H.I.P. so useful, C.H.I.P. Pro takes care of all the nuts and bolts, letting you get to the fun parts faster.

With Next Thing Co. and the thriving Chipster community from [bbs.nextthing.co](http://bbs.nextthing.co) at your side, we can't wait to see what you'll do with C.H.I.P. Pro!

# 1. Overview

---

At Next Thing Co., we work to make it easy to integrate computer hardware in products. C.H.I.P. Pro is powered by GR8, a system-in-package (SiP) that was designed by Next Thing Co. GR8 features a 1GHz Allwinner R8 ARM Cortex-A8 processor, Mali400 GPU, and 256MB of Nanya DDR3 DRAM in a 256-ball 14mm x 14mm FBGA package.

C.H.I.P. Pro is a system-on-module (SoM) that has 512MB of high-speed NAND storage flashed with our GadgetOS. It can be simultaneously and seamlessly powered by any combination of USB, DC Input, or Li-ion battery, all intelligently managed by the AXP209 PMU.

The module offers all the popular interfaces you'd expect. With two High-Speed UARTs, a Two-Wire Serial Interface, a parallel camera sensor interface, SPI, two PWM channels, USB 2.0 OTG port, and a USB 2.0 Host port, C.H.I.P. Pro is packed full of I/O expandability. Comprehensive audio handling includes a built-in 24-bit ADC/DAC for analog audio, S/PDIF and AES3-compatible One-Wire Digital Audio, as well as I2S digital audio for interfacing with professional audio codecs.

C.H.I.P. Pro is CE, IC, and FCC 47 CFR 15.212 certified as a modular transmitter, making integration into end products easy. The on-board Realtek 8723DS 2.4GHz combination module provides compliant Wi-Fi B/G/N and Bluetooth 4.2 Low-Energy connectivity. A software controlled antenna path selects between the on-board chip antenna or a U.FL / IPEX antenna connector where several pre-certified antennas can be added to optimize wireless range.

The module is rated to operate from 2.9V-6V input in environments ranging between 0 and 70 degrees Celsius, and measures 45 mm x 30 mm.

**C.H.I.P. Pro is \$16 in any quantity and includes custom factory flashing via Next Thing Co.'s Gadget software tools for orders of 1000 or more. Because we want everyone to have access to building great things at awesome prices, the minimum order quantity for C.H.I.P. Pro is one.**

We can't wait to see how you'll integrate C.H.I.P. Pro in to your next product, project, or prototype.

### 3.4. Power Consumption

C.H.I.P. Pro is designed for both battery and wall-powered embedded applications. The following measurements are offered as a rough starting point with which to begin to understand the range of power budgets relevant to a C.H.I.P. Pro-based device operated from a battery. Exact system power consumption is significantly influenced by factors such as software power optimizations (or lack thereof), power source quality, external peripheral circuitry, and ambient operating temperature.

### 3.5. Oscillator Electrical Characteristics

C.H.I.P. Pro contains a single 24.000MHz oscillator.

The 24.000MHz frequency is used to generate the main source clock for PLL and the main digital blocks, the clock is provided through X24MIN. The table below lists the 24.000MHz crystal specifications.

$R_{BIAS}$	Internal Bias Resistor	0.4	0.5	0.6	MΩ

### 3.6. Power Up/Down and Reset Specifications

C.H.I.P. Pro only requires that you apply voltage within the acceptable range to any or all of the AXP209's Intelligent Power Select inputs. Power up and power down sequence requirements for the GR8 SiP are handled by the on-board Power System provided by the AXP209 PMU and companion switching regulators.

NOTE: Designs which omit a battery source often require additional bulk capacitance on their DC Input to best handle high current transients during boot or initial peripheral operation, such as WLAN pairing. While similar budgets to those shown in the Power Consumption section are applicable to DC Source (wall-powered) designs, they can achieve greater PMIC efficiencies by using a higher input voltages when compared to battery-only designs.

For more details in specific system submodule power up/down timing, requirements, and design considerations please review the GR8 SiP documentation and AXP209 datasheet available at:

## 6.3. SMT Reflow Profile

**NOTE:**

C.H.I.P. Pro device designers should consult their manufacturer for an equipment-tailored reflow oven profile. The unique profile for each product is determined by the solder paste manufacturer's recommendations as well as the maximum thermal load of the parts to be soldered on the printed circuit board.

*Next Thing Co. recommends using ROHS and REACH compliant SAC305 solder paste, such as Alpha OM350 or Senju M705.*

Machine Type: ERSA

Conveyor Speed: 85cm/min

Solder Paste Type: Alpha OM350
